CENTRE FOR ADVANCED STUDIES

Dr. A.P.J. Abdul Kalam Technical University
Lucknow

Research Seminar Series

Seminar -6

Network Optimization for Deep Learning Models

DATE & TIME:
10th February 2021,
4:00 PM.

PLATFORM & WEB-LINK
Google Meet :
<https://meet.google.com/qny-kerz-cmw>

SPEAKER

Chhavi Bajpai

Research Scholar,
Centre for Advanced Studies
AKTU, Lucknow

ABSTRACT

Currently, deep learning is all around us. It's used to determine which online ads to display in real-time, identify and tag friends in photos, translate your voice to text, translate text into different languages on a web page, and drive autonomous vehicles and many other applications. It's a key technology that is achieving results that were not possible before. Recent advances in deep learning have improved to the point where deep learning outperforms humans in some tasks like classifying objects in images. It is being widely used to automate processes, improve performance, detect patterns, and solve problems and the range of its application is almost limitless. There are some design challenges still exist to build a deep learning model. This talk is all about the question "Why do we choose certain values in our neural network?" "Well just intuition and a little hit and trial"—it is the most common answer of this question which doesn't seem appropriate as this doesn't help us to know how efficient our model actually is and if there is any architecture combination which could help us achieve better generalized results. So, through this webinar some challenges with their solutions related to major design issues will be addressed which arise during building a deep learning model. Besides that, some existing research works and related research papers will also going to be a part of this session.
