ABSTRACT

Artificial Intelligence (AI) is an enabling technology that when integrated into healthcare applications and smart wearable devices such as Fitbits etc. can predict the occurrence of health conditions in users by capturing and analysing their health data. The integration of AI and smart wearable devices has a range of potential applications in the area of smart healthcare but there is a challenge in the black box operation of decisions made by AI models which have resulted in a lack of accountability and trust in the decisions made. Explainable AI (XAI) is a domain in which techniques are developed to explain predictions made by AI systems. This seminar proposes the involvement of XAI techniques to present the rationale behind predictions made by AI based systems to the stakeholders in the healthcare to gain the benefits such as Increased Transparency, Result tracking and Model improvement.
